These release notes cover the following Velocity Vision products and clients:

Velocity Vision Enterprise 2026 R1
Velocity Vision Pro 2026 R1
Velocity Vision Advanced 2026 R1
Velocity Vision Standard 2026 R1

Changes and solved issues

Changes compared to Velocity Vision VMS Products 2025 R3

A new component for storing, searching, filtering, and exporting Server Logs is now included in the VMS installer. It replaces the Velocity Vision Log Server.
A fresh installation will deploy a new solution. When updating the VMS from an older version, it is possible to either keep the old Velocity Vision Log Server component or install the new OTLP based solution.
A log data migration tool is placed in the Tools folder. This tool can convert old logs to new formats.
With the new logging components, it is now possible to easily integrate with any standard logging tool that supports OTLP.

A change in reason codes for closing alarms has been introduced.
We now have predefined reason codes and descriptions for closing alarms to enable the operator to work faster and more consistently when closing alarms.
It is possible to configure if the reason codes should be mandatory or optional for the operator to specify. If the alarm originates from an Access Control system, the close reason is sent back to the Access Control plugin.
This makes it possible for operators in Velocity Vision Client and e.g. Lenel to close alarms in either system, or the alarms will be synchronized both ways.

Event Server has gone through a lot of improvements regarding performance.
Performance for getting alarm list and alarm statistics has been improved significantly.
Before the user rights were looked up every time a call was made, now we store the information and only updates if they change.
These actions in the Velocity Vision Client benefit from this change:

- Select Alarm Overview tab
- Change between alarm and event view
- Any change to filtering alarms
- Report statistic table (State changes over time)
- Alarm List update

Changes compared to Velocity Vision Client 2025 R3

Like Velocity Vision Client 2025 R3, the Velocity Vision Client 7.1 is not a part of the main Velocity Vision VMS installer and must be downloaded separately. View individual Velocity Vision Client release notes for changes and updates.

Changes compared to Web Client 2025 R3

No changes.

Changes compared to Management Client 2025 R3

A reminder for license expiration has been introduced in the Management Client.
The user will be notified when the license is close to expiration. The first reminder will be 700 days before expiration, and it will be shown again every 70 days.

To support upcoming changes related to the SSA Activation Date, we have introduced a disclaimer on the license page in the Management Client.
The disclaimer is shown by pressing the '?' icon to the right of the 'Installed products' label.

Changes compared to Mobile 2025 R3

Since 2025 R3, four minor versions of Mobile Clients have been released.

2025 R3-2: bug fixes for Android
2025 R3-3: described in individual release note.
2025 R3-4: described in individual release note.
2025 R3-5: bug fixes for iOS & Android
2026 R1: described in individual release note.

For changes to Mobile Clients, view individual release notes for versions mentioned above.

Changes compared to Mobile Server 2025 R3

No changes.
