

Enterphone™ Family

Residential Telephone Entry System

The Enterphone Family is a feature-rich, integrated telephone entry system for facilities of any size, from small apartment buildings to large multi-family, multi-tenant condominium high-rises.

Using the same software-based design as Primis Access Control, the Enterphone system is scalable and integrates with both Primis as well as third-party Wiegand-based access control systems. All Enterphone products are configurable and administered using a common web-based browser.

The Enterphone panel product line offers many features, such as multiple languages, alternate number dialing, elevator control, and audio and visual screen prompts for visitor access. The system is scalable with other Enterphone panels to fit the

needs of the site regardless of size. Hirsch offers a variety of panels from a 10-inch screen version to a 19-inch Kiosk.

Each panel can be configured with custom screensavers, tailored to the needs of any building, with flush-mount and surface-mount options available. Designed for high traffic, each panel is encased in rugged stainless steel housing.

SIP enabled mobile application integrates with Enterphone panels to provide real-time audio and video capabilities directly to registered mobile devices.

Web-Based Administration

- Configuration and administration via web page hosted by each panel
- Easy administration access from any PC on the local area network
- Remote administration via any securely authenticated device

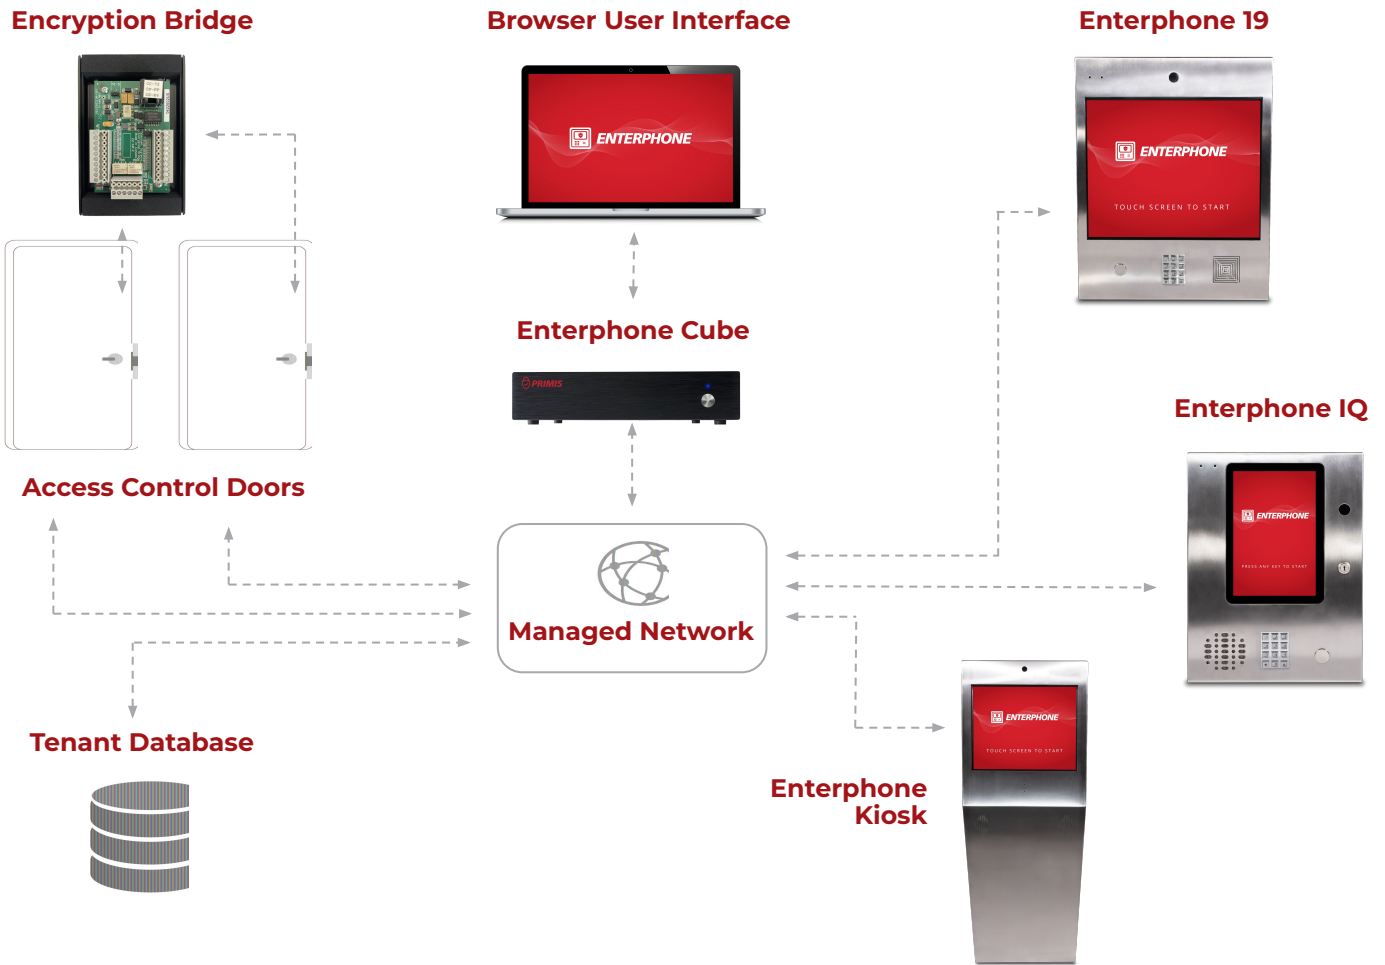

Flexible Options

- Models available in both touch screen and keypad driven
- Unlimited users/tenants and customizable screensaver
- Each panel supports up to four languages out of the box
- Enterphone Mobile Ready

Networked, Open, Scalable

- Standard IP securities
- Expands up to 16 readers with an Enterphone Cube or more with the Primis Cube and up to two access control card readers with Enterphone or Primis Encryption Bridges
- Scalable for multiple panels, buildings, and locations; with addition of Enterphone server, end-user can manage from a single interface and location
