

# Rapidly Deployable Detection Solutions

**Harper Chalice**  
Integrated Perimeter Security Specialists

# RapidPulse

## Rapid Deployable Detection & Deterrent

RapidPulse is the latest development from Harper Chalice in the Pulse Monitored Electric Fence Market. Rapid Pulse carries all of the same benefits of the standard PulseSecure system manufactured by Harper Chalice but comes in a modular design to allow rapid deployment into the field.

Developed in partnership with fellow British Manufacturers, Zaun Group and Highway Care, RapidPulse comes pre-assembled onto the SecureGuard fencing system. The combination of both solutions allow an area to be secured with perimeter intrusion detection as well as HVM protection very quickly.

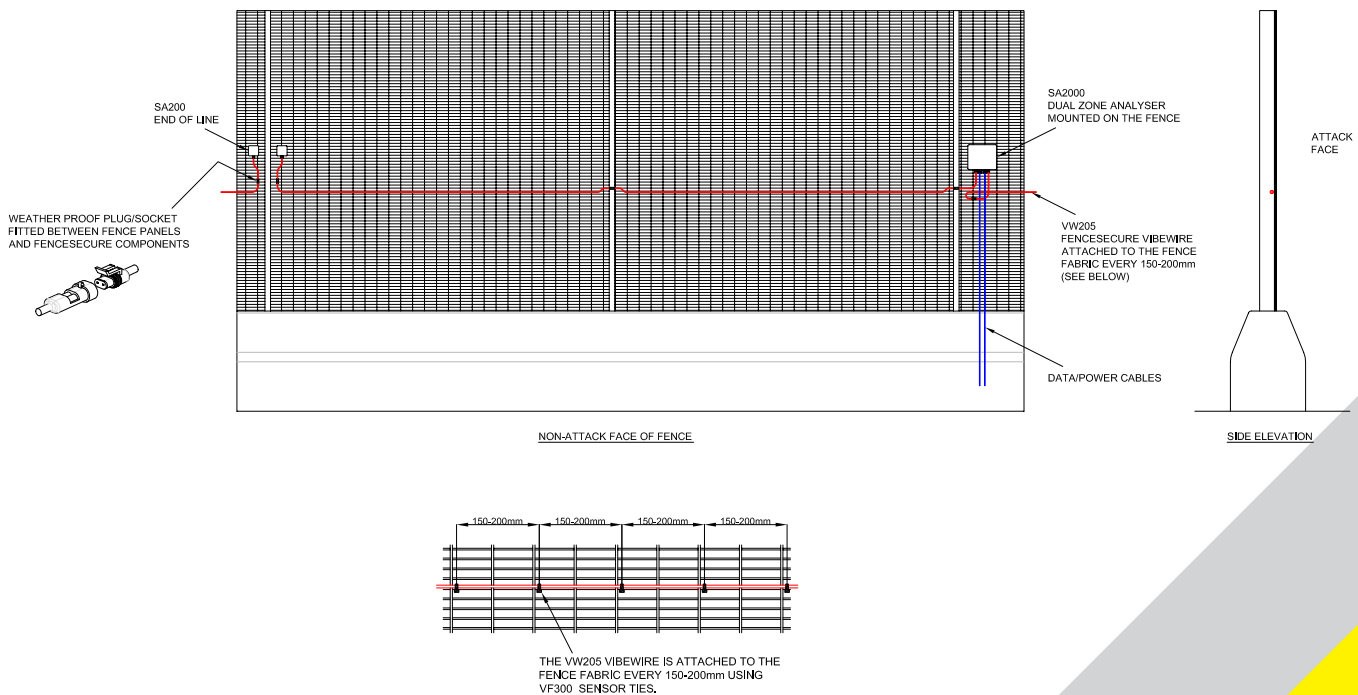

RapidPulse with SecureGuard can be deployed into an area without the need for civil works or any ground works. The full system can be deployed in a matter of hours providing complete protection of a site or area.

As with the standard Pulse monitored electric fence systems, it provides a psychological barrier as well as physical deterrent.

The RapidPulse system also provides a fantastic solution for temporary security where a break in a permanent perimeter is required without reducing the overall protection of the site. Quickly and easily deployed and adjusted it is the flexibility and performance of the system that sets it aside from other temporary solutions.

The system is fully compliant with BS 1722 Part 14 and Part 17. It can be supplied either Galvanised or Polyester Powder Coated with all system components manufactured in the UK.

## TEMPORARY FENCE TYPE AND CONSTRUCTION MAY DIFFER FROM THAT SHOWN

## Discreet & Reliable Detection

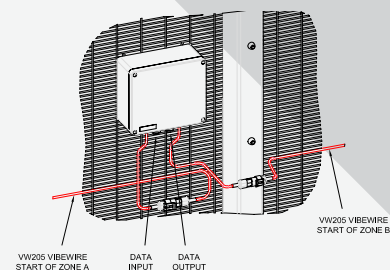

RapidSecure is the rapid deployable version of our FenceSecure system. FenceSecure is an approved solution for many high security and government applications and has been deployed successfully on many high profile projects. RapidSecure takes that same technology and proven performance and allows it to be utilised on a rapidly deployable fence.

Pre-assembled onto the mesh panels, RapidSecure uses a “plug & play” design to allow complete flexibility and speed of installation. Installation is simple and easy meaning that the system can be operational and providing protection against intrusion very quickly.

Able to detect intruders cutting and climbing the fence fabric, the system provides early warning of attempted breach of the perimeter and allows the relevant response to be organised quickly. When integrated with CCTV the solution can provide complete protection and monitoring of a secure boundary meaning the requirement for security patrols is reduced and allows more centralised or focused response teams.

The flexibility of the Rapid Secure system also means that when a temporary or semi-permanent perimeter needs to be adjusted or relocated, it isn't a problem. Simply disconnect, move and reconnect the system using the “plug & play” solution to restore the fully operation perimeter protection solution.

Harper Chalice are a UK Manufacturer specialising in perimeter intrusion detection with years of experience manufacturing and installing systems on High Security applications. These latest system developments further identify our continued commitment to product development and our customer needs.
